The Full Journey

What the user sees and what the backend does

This document follows one applicant from the landing page to approved member, including the admin verification in between. Each step shows what the user sees, what the backend does, and which function is responsible.

Part A: The applicant registers

Step 1. Landing page	T1, frontend
User sees	Clicks **Register as Volunteer**. The registration form opens.
Backend	No backend call yet, except that the form loads the 38 districts from the **districts** table (readable by everyone).

Step 2. Choose a username	T2
User sees	As the username is typed, the page checks whether the name is taken. It shows **Available** or **Already taken**.
Backend	**username_available(u)** returns true or false.

Step 3. Fill the form and submit	T2
User enters	Name, email, phone, address, district, Aadhaar, username, password.
Backend	**register** Edge Function runs and does all of this in one call: **1.** Validates everything. Phone must be 10 digits starting 6 to 9. Username 4 to 20 letters, numbers or underscore. Aadhaar must be exactly 12 digits. **2.** Rejects a duplicate username or email with a clear message. **3.** Creates the user in Supabase Auth with the password the applicant chose. **4.** Encrypts the Aadhaar. Stores the encrypted value and the last 4 digits separately. **5.** Inserts the **profiles** row with status = pending, role = null, membership_paid = false. **6.** Inserts a **notifications** row for admins: "New registration". **7.** Sends the welcome email with the username and a login link. **No password in it.** **8.** Returns a session, so the applicant is logged in immediately.
If input is bad	For example, an 11-digit Aadhaar: step 1 fails, the user sees a clear message, and **nothing is created**.

Step 4. Payment step	T3
User sees	**Pay Rs 365 membership** with a **Skip** option.
If they pay	**record_payment** verifies the gateway result (or mock), inserts a **payments** row, sets membership_paid = true, generates receipt number **TNV-R-2026-<n>** and a PDF, and stores the PDF in the private bucket. The user sees a success message and can download the receipt later from their profile.
If it fails or is skipped	Nothing else changes. The applicant is still registered and still enters the admin queue. **Payment is never a condition.**

Step 5. Applicant dashboard	T4, frontend
User sees	Only an **Under review** message. Status is pending.
Backend	The applicant cannot see WhatsApp links, the ID card or anything else. The database refuses it even if they try the URL, and the **/admin** page is refused too.

Step 6. Log out and log back in	T2
User does	Types their **username** and password.
Backend	The client calls **login_email_for(username)**, which returns the email. Then it signs in with email and password. Wrong username and wrong password give the **same generic error**, so nobody can discover which usernames exist.
User sees	The same **Under review** screen.

Part B: The Master Admin verifies the applicant

Step 7. Admin sees the new registration	T5
Admin sees	A **New registration** notification. The applicant appears in the queue, marked **unpaid** (unpaid applicants still show).
Aadhaar	Shown masked, like **XXXX XXXX 1234**. Only the last 4 digits are visible. If the admin clicks **Reveal**, **reveal_aadhaar(id)** returns the full number and writes an **audit_log** row recording who looked and when.

Step 8. First call attempt	T6
Admin does	Calls the applicant. No answer. Logs **No Answer**.
Backend	**log_call** inserts a **call_logs** row.
Admin sees	The history shows the attempt. The queue filter shows the applicant as **No answer**. After 24 hours they appear in the follow-up list.

Step 9. Scheduled, then attended	T6
Admin does	The applicant calls back and a time is agreed. The admin logs **Scheduled** and must enter a callback time. Without a time, **log_call** rejects it. Later the admin logs **Attended**.
Rule	There is no limit on attempts. The **latest outcome** is the applicant's current call status.

Step 10. Interview scoring	T7
Admin does	Asks the 10 questions and scores each one **0, 0.5 or 1**.
Backend	**save_scores** accepts only those three values and rejects anything else.
Admin sees	A running total. The admin picks a recommended role. It is only a suggestion, and **the admin's choice is what gets saved**.

Step 11. Mark Verified	T8
Admin does	Clicks **Verified**.
Backend	**approve_applicant** Edge Function runs: **1.** Checks that **every active question is scored**. If any are missing, it refuses. **2.** Sums the scores. **3.** Sets the role and changes status to **approved**. **4.** Generates the **TNV ID** (placeholder format TNV-<district code>-<running number>). **5.** Writes the **verifications** row (score, role, who approved, when). **6.** Sends the approval email. **7.** Writes an **audit_log** row.
Rule	Only this function can change status or role. There is no way back to pending in Phase 1.

Part C: The applicant sees the result

Step 12. Dashboard unlocks	T8
User sees	Within a minute, or after a refresh, the dashboard changes from **Under review** to the full member view.

Step 13. ID card and appointment letter	T9, frontend
User sees	An **ID card** and an **appointment letter** with their name, role, district and TNV ID. Both can be downloaded.
Backend	The frontend builds these from data the backend produced.

Step 14. WhatsApp links	T10
User does	Opens the WhatsApp section.
Backend	**my_links()** returns the user's own district link, their wing link, all 13 sector links, announcements and social links. A user from a different district gets their own district link. A pending user gets **zero rows**.

Step 15. Paid applicant case	T3
User sees	If they paid, they can download their receipt from their profile at any time.
